# Sales Forecasting for a Retail Chain – Detailed Project Report

## 1. Introduction

This project focuses on building a predictive system to forecast retail sales using Machine Learning techniques. The system includes data exploration, SQL-based analytics, regression modeling, and an interactive Streamlit dashboard. It helps businesses understand sales patterns and make informed decisions.

## 2. Objective

The primary objectives of this project are:

- To analyze historical retail sales data.

- To identify trends, correlations, and influential factors.

- To train a regression model to predict future sales.

- To integrate SQL querying for flexible data analysis.

- To develop an interactive dashboard using Streamlit for real-time insights and predictions.

## 3. Methodology

The project follows a structured workflow consisting of:

1. Data Loading: Reading CSV using pandas.

2. EDA: Visualizing distributions, correlations, and trends.

3. SQL Integration: Storing data in SQLite for advanced querying.

4. Model Building: Training Linear Regression for prediction.

5. Dashboard Development: Creating a Streamlit-based web interface.

Technologies Used:

- Python (pandas, numpy, matplotlib, seaborn, sklearn)

- SQLite

- Streamlit

- Jupyter/VSCode for development

## 4. Code and Implementation Details

# CODE FROM sales_script.py that is responsible for the **core data science workflow**.

## 5. Work of each python script

### sales_script.py-

1. Loads the Dataset

- Reads your CSV file (e.g., uploaded sales data).
- Performs basic checks on missing values and data types.

2. Data Preprocessing

- Handles missing values.
- Converts date columns if needed.
- Splits dataset into training and testing sets.

3. Model Training

- Trains machine learning models (like Random Forest, XGBoost, or Linear Regression depending on your version).
- Fits the model on the training data.

4. Model Evaluation

- Calculates accuracy metrics such as:
  - RMSE (Root Mean Square Error)
  - MAE (Mean Absolute Error)
  - $R^2$ Score
- Displays evaluation results so you know how good the model is.

5. Saving the Trained Model

- Stores the trained model as a .pkl file (usually model.pkl).

- This saved model is later used by the dashboard (streamlit_app.py).

6. Generates Plots

- Creates visual insights such as:
    - Actual vs Predicted graphs
    - Feature importance chart
    - Trend lines, etc.
- These plots can be used in your report or dashboard.

7. Enables Integration With Streamlit

- The script prepares outputs (model + files) that Streamlit reads for real-time predictions in streamlit_app.py.

app.py

1) Dataset

- Displays the full dataset.
- Shows summary statistics using df.describe().

2) EDA (Exploratory Data Analysis)

- Displays a correlation heatmap of numeric columns.
- Shows a sales distribution histogram.
- If a Date column exists, plots sales over time.

3) SQL Query

- Provides a text area for users to write SQL queries.
- Executes the query on the SQLite database and displays results.
- Handles errors gracefully.

4) Model Training

- Cleans the data by dropping missing values.
- Selects numeric features (excluding "Sales") for training.
- Allows users to set test size and random seed.
- Trains a Linear Regression model.
- Displays performance metrics:
    - $R^2$ Score
    - MAE (Mean Absolute Error)
    - MSE (Mean Squared Error)
    - RMSE (Root Mean Squared Error)
- Plots Actual vs Predicted values.
- Stores the trained model and feature list in st.session_state.

5) Prediction

- Allows users to input values for each feature.
- Uses the trained model to predict sales.
- Displays the predicted sales value.

6) Technologies Used

- Streamlit: UI and interactivity
- Pandas: Data manipulation
- SQLite: SQL query execution
- Matplotlib & Seaborn: Data visualization
- Scikit-learn: Machine learning (Linear Regression)

## 6. Results and Observations

Key outcomes of the project:

- The regression model successfully predicted sales with acceptable accuracy.

- Visualizations revealed strong correlations among numerical features.

- SQL queries helped identify high-performing segments.

- The Streamlit dashboard enabled real-time analysis, model training, and prediction.

- Sales Distribution Graph

- Correlation Heatmap

- Actual vs Predicted Plot

## 7. Conclusion

The project successfully met its objectives by creating a functional end-to-end sales forecasting system. It demonstrates the power of combining data science, SQL analytics, and interactive dashboards. Future improvements may include adding advanced ML models, hyperparameter tuning, or deploying the dashboard online.
